Mentor Meeting #1 - Agenda

Items

- Introduce ourselves
    - names should be enough
- Overview of our app idea, Fireplace
    - todo list that doesn't overwhelm user with too many tasks
    - only shows relevant tasks, unless specified otherwise
    - Concepts
        - Task
        - Filter
        - Classification
- Design questions
    - Nature of Classifications and possible options
        - single vs multiple Classifications per task (category vs tag)
        - possible filters: times of day, days of week, location, important, long, due date
        - filter rules
        - which filters take precedence if multiple selected? or will no conflicts arise if we just union all applied filters, and is that the most intuitive way?
    - Balance between simplicity and user freedom
        - favor quick and simple user interaction over complicated filters
        - small amount of user input when listing tasks to select location (would override GPS) and to toggle showing tasks deemed long/important
    - Data model
        - modeling filters
- Implementation questions
    - any suggestions for API/gem to help retrieve current location
    - if not, any strategies for finding one
- Ask about critique due on Sunday

    - good strategies
    - common issues that we should avoid
